1. Introduction

Project Title: Implement Client Script & UI Policy (Incident)

Team Members: HARISH V, Jairaj R, KARTHIKEYAN S, KARUPPUSAMY PRAVEEN N
Platform: ServiceNow

2. Project Overview

Purpose: To enforce data integrity on Incident records using UI Policies and Client Scripts.

Key Features:

- High Impact UI Policy control.
- Mandatory Assignment group for High Impact.
- Read-only Urgency for High Impact.
- Automatic Urgency = High on High Impact.
- Save prevention when Assigned To is missing.
- List-edit prevention for State.

3. Architecture

Application Architecture: The solution is implemented within the ServiceNow Incident application.

UI Layer: Incident form and Incident list.

Business Interaction Layer: UI Policies, UI Policy Actions, and Client Scripts.

Data Layer: ServiceNow Incident records.

No separate React frontend, Node.js/Express backend, or MongoDB database is used in the supplied project.

4. Setup Instructions

Prerequisites:

- Access to the relevant ServiceNow instance.
- Permission to configure Incident UI Policies and Client Scripts.
- Access to the Incident table and form/list.

Configuration:

- Create the UI Policy named High Impact Control on the Incident table.
- Configure UI Policy Actions for Assignment group and Urgency.
- Create the onChange Client Script Auto set urgency for high impact.
- Create the onSubmit Client Script Prevent save if Assigned To missing.
- Create the onCellEdit Client Script Prevent state change via list edit.

5. Folder Structure

Not applicable in the same way as a traditional source-code application. The project is organized as ServiceNow configuration records:

Configuration Type	Name
UI Policy	High Impact Control
UI Policy Action	Assignment group mandatory
UI Policy Action	Urgency read-only
Client Script – onChange	Auto set urgency for high impact
Client Script – onSubmit	Prevent save if Assigned To missing
Client Script – onCellEdit	Prevent state change via list edit

6. Running the Application

Open the configured ServiceNow instance, navigate to the Incident application, and create or edit an Incident record. The UI Policies and Client Scripts execute during the corresponding form or list interactions.

No local npm start commands are applicable to this ServiceNow project.

7. API Documentation

No custom REST API endpoints are specified in the supplied project material. The project uses ServiceNow form APIs, including g_form, for client-side field operations.

8. Authentication

The supplied project material does not specify a custom authentication implementation. Access to the ServiceNow instance is assumed to be controlled by the platform's configured user access and roles.

9. User Interface

The primary user interface is the ServiceNow Incident form and Incident list. The project dynamically changes field behavior based on Incident Impact and controls State editing.

Separate UI screenshots were not supplied in the project source and can be inserted from the completed instance.

10. Testing

Testing covers UI Policy behavior, automatic field updates, mandatory-field validation, successful/blocked saves, reverse conditions, list-edit prevention, and form-based State updates.

Test Case	Expected Outcome	Status
High Impact → Assignment group mandatory	Mandatory	Pass
High Impact → Urgency read-only	Read-only	Pass
Impact changed to High	Urgency = High	Pass
Assigned To empty + High Impact save	Save blocked	Pass
Assigned To filled + High Impact save	Save succeeds	Pass
State edited from list	Edit rejected	Pass
State edited from form	Update allowed	Pass

11. Screenshots or Demo

Demo/Instance Link: Not specified in the supplied project source.

Recommended screenshots: High Impact form, mandatory Assignment group, read-only Urgency, save validation error, and blocked State list edit.

12. Known Issues

- No open defect is reported in the supplied testing results.
- Measured performance metrics are not included in the supplied project material.

13. Future Enhancements

- Extend validation to additional Incident fields.
- Add more automated Client Script test scenarios.

- Introduce broader role-based controls.
- Add monitoring/reporting for validation failures.
